

# Assessing and Implementing AI and ML in Healthcare - Module One

## *Welcome to the Assessing and Implementing AI and ML in Healthcare Course!*

*Before proceeding with the "start module", read below for additional important information.*

This course is comprised of four modules of content. In Module One, you will learn how Artificial Intelligence (AI) and Machine Learning (ML) have influenced health ecosystems. This course equips you with the tools to assess your healthcare operations and systems, fostering strategic decision-making for implementing Artificial Intelligence and Machine Learning. It's time to jump into the content!

Scroll to the top and click the "**Start Module**" button to begin.

## Going through the course

As you work through the content for each module, scroll down to view all the material in each section.

## Learning Outcomes

Upon completion of this course, the following four (4) learning outcomes will be achieved:

1

**Explain** the fundamental concepts of Artificial Intelligence and Machine Learning in health ecosystems.

2

**Identify** specific components of the Machine Learning Life Cycle Management Process (MLOps).

3

**Understand** the ethical implications and evaluation framework for data harmonization and the scoreboard for success.

4

**Gain** practical skills implementing AI/ML applications from use case development within a healthcare system.

## Module One Learning Objectives

Let's dive into our first goal of the fundamental concepts of Artificial Intelligence and Machine Learning in health ecosystems. For this module, we will:

1

Define foundational concepts about Artificial Intelligence (AI) and Machine Learning (ML).

2

Understand the important stakeholders involved in use cases of AI across the health ecosystem.

3

Describe the benefits and limitations of AI/ML.

4

Recognize the tradeoff of engaging and implementing AI.

Click on the '*Play*' button to start the video.

Click on each **number marker** to find out more information about the different areas to navigate through for a good learning experience.

The screenshot shows a course interface with a dark blue header and a yellow navigation bar. The header displays the course title and a progress bar at 17% complete. The navigation bar lists several topics: Navigation, Introduction, Meet Our Expert, Understanding The Fundamentals of AI/ML in Healthcare, Who Are The Stakeholders?, and Benefits and Limitations of AI/ML. A sidebar on the left contains a search icon and a list of topics. The main content area features a large blue graphic with circular patterns and four numbered markers (1, 2, 3, 4) indicating different sections. Below the graphic, the 'Learning Outcomes' section lists four outcomes, each preceded by a numbered marker. A 'CONTINUE' button is located at the bottom right.

## Learning Outcomes

In order to get a clear understanding on the specific knowledge and skills about data analytics, you will learn relevant and practical skills about this topic. Here are the learning outcomes from this course.

- Identify and interpret data to inform business decisions
- Perform data preparation procedures
- Recognize trends, detect outliers, and summarize data sets
- Validate analytical reports
- Analyze relationships between variables
- Develop and test hypotheses using inferential methods
- Select the appropriate collection methods to obtain data

This icon represented by three (3) stacked vertical lines provides more viewing real estate for the learning content.

# Meet Our Expert

---

## **Brian Anderson, MD**

### **Co-Founder & Chief Executive Officer**

#### **Coalition for Health AI (CHAI)**

Internationally recognized expert and author in digital health and Health AI

---

Dr. Brian Anderson, co-founder of the Coalition for Health AI (CHAI) in 2021, serves as its CEO. CHAI is dedicated to establishing consensus-driven guidelines and best practices for Responsible AI in Health, while also facilitating independent testing and validation of AI for safety and efficacy.

Before heading CHAI, Dr. Anderson served as MITRE's Chief Digital Health Physician, spearheading research and development in digital health alongside industry partners and the U.S. Government. He led critical initiatives during the COVID-19 pandemic, collaborating with the White House COVID Task Force and Operation Warp Speed. Additionally, he led MITRE's significant R&D endeavor in Oncology, pioneering mCODE development and utilizing AI for enhanced clinical trial design.

Dr. Anderson, a renowned digital health expert, is a sought-after speaker on topics including digital health innovation, health standards, clinical decision support systems, and interoperability. Before joining MITRE, he led the Informatics and Network Medicine Division at athenahealth and contributed to various national and international health IT committees alongside organizations such as the Office of the National Coordinator (ONC), the National Institutes of Health (NIH), and the Organization for Economic Cooperation and Development (OECD).

## **A Realistic Perspective**

Listen as Dr. Anderson shares a real perspective on how artificial intelligence is being implemented in healthcare to move forward with frameworks that make sense.

# Understanding The Essentials of AI/ML in Healthcare

---

---

**There is a lot of work out there to take people out of the loop in things like medical diagnosis. But if you are taking humans out of the loop, you are in danger of ending up with a very cold form of AI that really has no sense of human interest, human emotions, or human values.**

**Louis B. Rosenberg**

---

**Let's dive into our first goal of the fundamental concepts of artificial intelligence and machine learning in health ecosystems.**

# Artificial Intelligence or Augmented Intelligence?

To figure out the appropriate use cases for using AI, it's important to understand the essentials of the concepts.

The goal of artificial intelligence is to simulate humanistic intelligence in machines, empowering them to carry out complex tasks and decision-making processes autonomously.

The goal of augmented intelligence is to improve decision-making without taking humans out of the equation.

## Artificial Intelligence

**A field that combines computer science and robust data sets to enable problem-solving. It is the collection of computer systems simulating human intelligence.**

## Augmented Intelligence

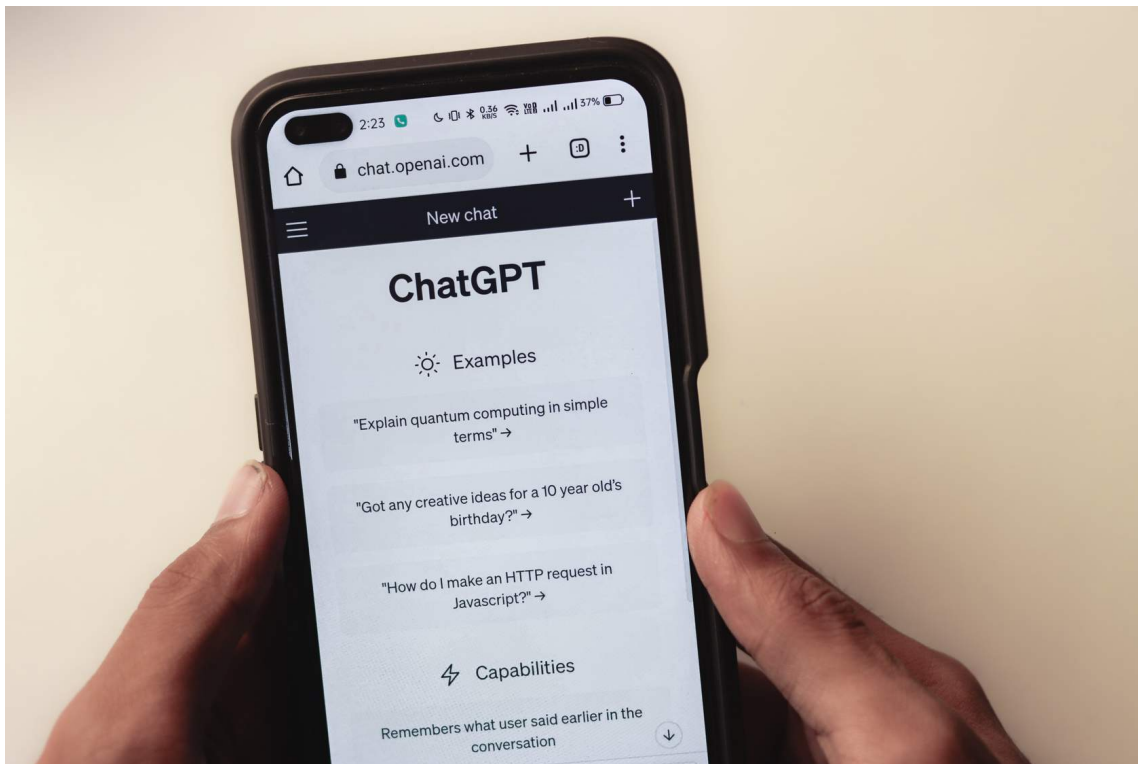

**A design pattern for a human-centered partnership model of people and artificial intelligence (AI) working together.**

### NATURAL LANGUAGE PROCESSING

### LARGE LANGUAGE MODEL

### DATA PRODUCTS

Natural language processing (NLP) - a type of AI that enables computers to understand spoken and written human language. NLP enables features such as text and speech recognition on devices. Examples of NLP are improved searches, Siri, Alexa, chatbots, autocorrect, social media analytics, speech recognition, spell check, and more.

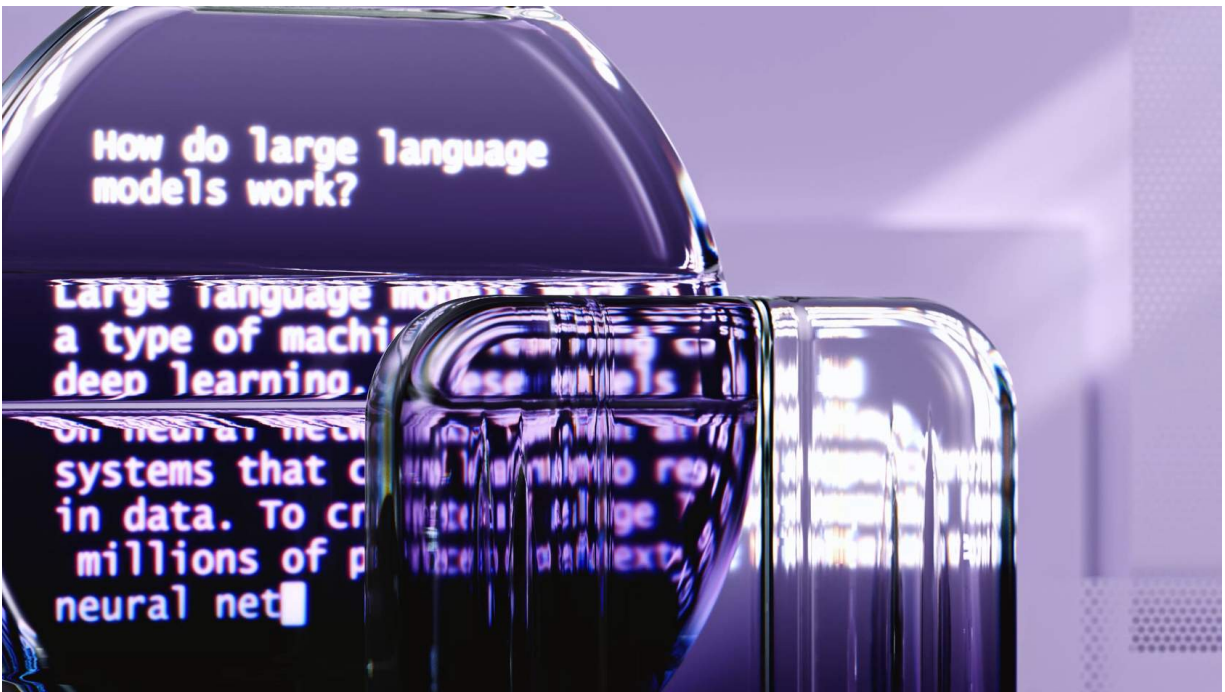

**NATURAL LANGUAGE  
PROCESSING**

**LARGE LANGUAGE MODEL**

**DATA PRODUCTS**

A large language model (LLM) is an AI model that has been trained on large amounts of text so that it can understand language and generate human-like text to convey ideas and concepts. Examples are Google's BERT, Claude, Cohere, and Falcon 40B to name a few.

**NATURAL LANGUAGE  
PROCESSING**

**LARGE LANGUAGE MODEL**

**DATA PRODUCTS**

These are any products or features utilizing data to facilitate goals. It is very different from data-as-a-service (DAAS) which uses technology and is an innovative way of selling external data. Data products involve collecting, analyzing, and using data to provide insight, information, or functionality to help address specific needs or business challenges.

Types of data products in healthcare are electronic health records (EHR), administrative data, claims data, patient/disease registries, health surveys, and clinical trial data.

## The Health Ecosystem

**Ms. Lee Kim, JD CISSP/US FHIMSS**

**Senior Principal, Cybersecurity and Privacy**

HIMSS

---

**Lee Kim** is the Senior Principal, Cybersecurity and Privacy at the Healthcare Information and Management Systems Society (HIMSS) North America. Lee's roles include subject matter expert, public policy professional, and analyst. She is a member of the U.S. DHS Analytic Exchange Program and the National Cybersecurity Training & Education Center (NCyTE) National Visiting Committee.

Lee is an AV Preeminent peer review-rated attorney in healthcare and intellectual property law.

Listen as **Anne Snowden, HIMSS Chief Research Officer** provides perspectives on the landscape of artificial intelligence in healthcare, illustrating how the health systems she

collaborates with effectively leverage this technology to address both clinical and operational challenges. Click the **'Play'** button.

# Who Are The Stakeholders?

---

**“ The first rule of any technology used in a business is that automation applied to an efficient operation will magnify the efficiency. The second is that automation applied to an inefficient operation will magnify the inefficiency.”**

**Bill Gates**

## Understanding The Important Stakeholders Involved in AI

The use of AI in the health ecosystem involves a diverse set of stakeholders, each playing a crucial role in the development, implementation, and utilization of AI technology.

## Introduction

Stakeholders include a wide range of parties, such as employees, government agencies, communities, and more. In various contexts, stakeholders may have different levels of influence and interests. In the health ecosystem, this role is an integral part of clinical, administrative, business solutions, and much more. Stakeholders may have different levels of influence and interest. Recognizing and understanding the needs and expectations of stakeholders is crucial in the health ecosystem.

Let's explore the pivotal roles of stakeholders in shaping the landscape of AI/ML in healthcare.

Click on the **START** button or **arrow** to advance in learning about some of the important stakeholders.

## Healthcare Providers

A healthcare provider is a person or entity that provides medical care or treatment. Healthcare providers include doctors, nurse practitioners, midwives, radiologists, labs, hospitals, urgent care clinics, medical supply companies, and other professionals, facilities, and businesses that provide such services.

## Patients

Any recipient of healthcare services that are performed by health care professionals.

## Pharma and Biotech Companies

Both biotechnology and pharmaceutical companies have similarities and are distinct from each other.

**Biotechnology companies** use living organisms to manufacture products or solve problems.

**Pharmaceutical companies** research, develop and market medicines made primarily from artificial sources.

## Tech Companies

Technology companies focus on the manufacturing, support, R & D of computing, telecommunication, and consumer electronic-based technology-intensive products and services. These include digital, software, optics, new energy, cloud storage, and e-commerce.

## Research & Academia

Healthcare research comes in three main areas - experimental, clinical, and epidemiological. Clinical and epidemiological studies are subclassified as interventional and noninterventional.

Academia is combining research and medical education providing the best possible clinical care.

## Government Agencies & Compliance Experts

Government entities or institutions with global reach possess the authority and power to establish and enforce laws, regulations, and policies. They are also responsible for safeguarding the rights and interests of citizens.

Compliance experts have extensive knowledge and experience with compliance programs.

## Summary

As you see, stakeholders range from various individuals, groups, or entities that have an interest, concern, or investment in healthcare. These roles are pivotal in Artificial Intelligence conversations, planning, and implementation in the health ecosystem.

# Benefits and Limitations of AI/ML

---

**“The key to artificial intelligence has always been the representation.”**

**Jeff Hawkins**

## Benefits

In the ever-evolving landscape of healthcare, the integration of AI/ML emerges as a transformative force, offering a multitude of benefits that can revolutionize patient care, streamline operations, and finance, and drive advancements. Here is a list of benefits for AI/ML implementations. Click on each '+' to see the information.

## **Automation**

AI and ML can automate repetitive tasks, increasing efficiency and reducing the need for human intervention.

## **Data analytics**

Excelling at analyzing large datasets, identifying patterns, and extracting valuable insights leading to data-driven decision making.

## **Personalization**

Customized recommendations for user experience through understanding behaviors and preferences in health ecosystems.

## **Predictions**

Looking at future trends and outcomes based on historical data, sound forecasting could occur for planning, financial forecasting, and risk management.

## **Improved efficiency**

Contribute to faster and more accurate diagnostics, personalized treatment plans, drug discovery, and ultimately improving patient outcomes.

### **Natural Language Processing (NLP)** —

Understand and process human language, enabling applications, for example, chatbots and language translation.

### **Fraud detection and security** —

Detecting abnormal occurrences and patterns associated with fraudulent activities, enhancing cybersecurity measures.

### **Cost reduction** —

Automation and efficient improvements leading to cost savings to minimize errors, streamline processes, and optimize resource utilization.

## **Limitations**

While the integration of AI/ML holds immense promise in healthcare, it is crucial to acknowledge the inherent challenges and limitations associated with their

implementation. Furthermore, the complex and dynamic nature of healthcare systems poses challenges in achieving universal standardization, hindering seamless integration. Acknowledging these limitations is essential to foster responsible and effective implementation, ensuring the potential of AI/ML in healthcare is realized without compromising ethical standards and patient outcomes.

Here is a list of limitations for AI/ML implementations. Click on each '+' to see the information.

### **Lack of understanding and interpretation** —

Operating as “black boxes”, making it hard to understand how to reach specific decisions, concern about transparency and interpretation.

### **Data dependency** —

Due to the reliance on large and high-quality data sets, biased or incomplete data can lead to biased model predictions and inaccurate results.

### **Ethical concerns** —

Ensuring fairness and avoiding discrimination in AI as well as bias and privacy.

## **Overfitting** —

Undesirable machine learning behavior due to ML model giving accurate predictions for training data but not for new data.

## **Security risks** —

The potential for adverse attacks manipulating input data to deceive AI models.

## **Job displacement** —

Job loss due to AI and ML model implementations.

## **Resource intensiveness** —

Using sophisticated ML models that require a lot of resources including powerful hardware and energy sources.

## **Unable to handle unforeseen scenarios** —

Systems may struggle to adapt to unexpected or unprecedented situations due to relying on pre-existing patterns in data.

## Use Case That Is Striking Balances

Listen as Rachini Moosavi, Chief Analytics Officer at UNC Health, shares the experiences from UNC but also gives you some hard capabilities that are empowering the staff at UNC to not have tunnel vision but be a leader with this technology. Click the '[Play](#)' button.

# Tradeoffs of Engagement and Implementation

---

**“It is difficult to think of a major industry that AI will not transform. This includes healthcare, education, transportation, retail, communications, and agriculture. There are surprisingly clear paths for AI to make a big difference in all of these industries.”**

**Andrew Ng**

## Recognizing Trade-offs

When looking at the health ecosystem landscape, tradeoffs can look different depending on the situational decision; however quality and quantity should remain a

focal point in addressing gaps, workflows, financial health, and clinical settings. Here is a list of possible tradeoffs to consider when implementing AI/ML.

1

**Data Privacy and Security:** Balancing the utilization of sensitive data for AI applications with the imperative to uphold stringent data privacy and security measures.

2

**Cost vs. Benefit:** Evaluating the financial investments required for AI implementation against the expected benefits and returns, considering both short-term and long-term impacts.

3

**Interoperability and Standardization:** Managing the tension between the flexibility of AI systems and the need for interoperability and standardized data formats to ensure seamless collaboration within diverse healthcare systems.

4

**Workflow Integration and Acceptance:** Navigating the integration of AI into existing workflows while considering user acceptance, minimizing disruptions, and ensuring a smooth transition for healthcare professionals.

5

**Regulatory Compliance:** Adhering to established healthcare regulations and standards while adapting to the evolving landscape of AI technologies, ensuring compliance with ethical and legal requirements.

6

**Explainability vs. Performance:** Balancing the need for transparent and understandable AI decision-making processes with the pursuit of high-performance models that may be more complex and less interpretable.

7

**Clinical Authentication and Evidence:** Weighing the potential benefits of AI-driven clinical decisions against the necessity for robust authentication and evidence-based practices in healthcare.

---

8

**Limited Generalization:** Acknowledging the challenge of limited generalization, where AI models may not perform equally well across diverse populations or under varying conditions.

9

**Human-AI Collaboration:** Defining the roles of humans and AI in collaborative healthcare settings, ensuring effective communication, and leveraging the strengths of both to optimize patient care.

10

**Continuous Monitoring and Maintenance:** Balancing the ongoing need for monitoring and maintenance of AI systems to ensure their reliability and effectiveness over time against resource constraints and potential disruptions.

**In the generative model and large language models, developing a framework for interpreting the results and accuracy of the results is hugely important and consequential.**

### **Real-world Performance: Human-centric**

Listen as Sunil Dadan, EVP and CIDO at Atlantic Health, provides insight from challenges and advice when evaluating and engaging with AI/ML implementations. Click the ['Play'](#) button.
